Prosjektbakgrunn

- ▼ Utvikling av høytrykksinjeksjon for tetting av bergrom og tunneler. Vet vi hva vi gjør?
- ▼ Hvilke utfordringer har vi ved høytrykksinjeksjon?
- ▼ Kan vi beskrive det fysiske som skjer med både bergmassen, injeksjonsutstyret og injeksjonsmaterialet?

Adm. info

- ☛ KPN i BIA (brukerstyrt innovasjonsarena). Kompetanseprosjekt som kommer hele bransjen til gode, og fremme resultater gjennom publisering. Vi skal bygge kompetanse i prosjektet, men den enkelte deltager kan selv skaper egne innovasjoner.
- ☛ Budsjetttramme 16,6 mill (NFR 12 mill, øvrige partnere 3 mill, SVV+JBV 1,6 mill)
- ☛ Konsortiumavtale med samtlige partnere er signert
- ☛ SINTEF er hovedpartner mot NFR

Mål

- ☛ Økt kunnskap og dybdeforståelse av hvordan bergmassen responserer på ulike injeksjonsparametere for optimalisering av eksisterende metoder og prosedyrer.
- ☛ Økt kunnskap til å kunne differensiere mellom hensiktsmessig bruk av materialer og trykkregime, metoder og utstyr
- ☛ Økte kostnads- og tidseffektive injeksjonsmetoder som gagner byggherren, entreprenøren og leverandøren.
- ☛ Redusere risiko knyttet til leveransekvalitet (kvalitetskrav) og levetid.
- ☛ Utvikle optimale løsninger for innlekkasjekontroll i undergrunnsanlegg.

Gjennomføringsmodell

Tentativ fremdrift

Arbeidspakker

WP1 Project management

WP2 Collecting existing material & current state-of-the-art

WP3 Grout materials understanding

WP4 Flow models in rock description

WP5 Numerical modeling of coupled flow & rock models

WP6 Scaled laboratory model

WP7 Full scale testing work site/underground test facility

WP8 Monitoring

WP9 State-of-the-art at project completion. Innovation potential

WP10 Dissemination

Arbeidspakker

WP	Hovedmål, aktiviteter
1	Project management. Run and manage the project. Report to the steering committee and the Norwegian Research Council
2	Collecting existing material & current state-of-the-art. Literature study. Prepare state-of-the-art as the project start up. Report based on collected material from JBV/SVV/participants
3	Grout materials understanding. Description of base material being cement-based and testing on. <ul style="list-style-type: none">• Rheological description/physical material description• Structure building opc/mc• Testing of material structure by exposure to pressure in laboratory• Testing materials + different additives• Testing cured core
4	Flow models in rock description. <ul style="list-style-type: none">• Identify existing flow models, theoretical• Identify/document the flow and head loss from pump to rock mass, and prepare statistical description of rock Make a descriptive constitutive model of grout flow and flow loss through entire system

Arbeidspakker forts.

WP	Hovedmål, aktiviteter
5	Numerical modelling of coupled flow & rock models. <ul style="list-style-type: none">• Establish constitutive model• Identify suitable software code• Run tests to indicate connections and responses
6	Scaled laboratory model. <ul style="list-style-type: none">• Run tests on laboratory test equipment• Vary parameters as grout/additives/rock type/grout hole diameter modelling Report on findings from investigations
7	Full scale testing work site/underground test facility. Test theories by full scale testing under controlled circumstances. <ul style="list-style-type: none">• At work sites• Dedicated tunnels Hagerbach/Runehammer• Application of equipment /materials / monitoring Report on findings from testing
8	Monitoring. <ul style="list-style-type: none">• Establish systems for pressure monitoring at various locations in the grout hole/rock mass• Wireless transmission

Arbeidspakker forts.

W P	Hovedmål, aktiviteter
9	<p>State-of-the-art at project completion. Innovation potential.</p> <ul style="list-style-type: none">• Identify and forward innovation potentials to the partners to form their base for new technology <p>Prepare a concluding report summarising project</p>
10	<p>Dissemination.</p> <ul style="list-style-type: none">• Arrange internal workshops and meetings, coordinate articles and papers, arrange final open work shop for the industry

Status pr. februar 2015

- ☛ Oppstartsmøte med partere holdt 2. oktober 2014.
- ☛ Arbeidspakker WP2, WP3, WP4 og WP7 fordelt mellom SINTEF, NTNU og NGI.
- ☛ Oppstartsmøte i WP3 med BASF og Mapei 25. februar 2015.
- ☛ PhD søknadsfrist 15. januar 2015. Status?
- ☛ Sommerjobb og MSc-oppgaver vurderes i disse dager.
- ☛ BeFo i Sverige har vist interesse i prosjektet. BeFo har 10 års plan for FoU innen injeksjonsteknikk.
- ☛ NTU i Singapore vil gjerne samarbeide med egne midler for 2 PostDoc/Research Fellows. De kommer til Norge når vi kan avklare oppgaver.
- ☛ KIGAM og KICT er klare for å være med på ulike elementer som passer deres profil (egen finansiering).

WP3 Grout material understanding

1. Literature study

- grain size, structure
- rheology (viscosity, bleeding, setting time)
- penetration, yield strength, filtration stability, permeability
- ...

2. Lab testing

- grout (+ add.)
 - grain size
 - thickening/setting time
 - pressure test
 - yield strength
 - penetrability
- grouted samples (while curing/cured)
 - compressive & bonding strength
 - compressibility & swelling during curing/cured spec.
 - permeability
 - monitoring penetrability
 - air entrapment in grout (CT-scan?)
 - adhesion to joint surface (CT-scan?), cement+add.
 - cement structure (SEM?)

WP4 Flow models in rock description

- ☛ Identify existing flow models, theoretical
- ☛ Identify/document the flow and head loss from pump to rock mass, and prepare statistical description of rock
- ☛ Make a descriptive constitutive model of grout flow and flow loss through the entire system

WP6 Scaled laboratory model

- ☛ Run tests on laboratory test equipment
- ☛ Vary parameters as grout/additives/rock type/grout hole diameter modelling
- ☛ Report on findings from investigations

WP7 Full scale testing

- ☛ At work sites
- ☛ Application of equipment /materials / monitoring
- ☛ Report on findings from testing
- ☛ Utilize the test equipment developed in the R&D-project "FoU-prosjekt: måling av injeksjonstrykk i bergmassen in situ" for measuring the pressure distribution in nabouring grout holes and the ability to penetrate fractures for different grout materials and recipes.
- ☛ Interpretation of injection tests to monitor hydro-mechanical behavior of rock joints. Determining onset of hydraulic jacking/fracturing during different pressure build-up regimes/various viscosities, possibly normalization of jacking pressure.
